Horrible code document

The calculator I made for this assignment can add, subtract, divide, and multiply after receiving input from the user.

It follows the KISS, DRY, Document your code, and Clean code principles

It follows KISS and DRY by keeping all the code simple and easy to understand without complicated logic and DRY by not repeating anything it doesn't need to.

The code is also Documented with comments and all the variables have appropriate names.

It also follows clean code by having each function do one thing correctly and the functions are written in a way that is very readable.

The horrible version violates these by complicating the functions with overcomplicated logic making the code much harder to read for no reason. The code often repeats itself and does not use comments or appropriate naming conventions. Lastly, the extra spaces ruin the prose.
